# Tip cards layout

As we wanted to implement our tips in a slide-card system layout, we had some different concepts to choose from in the beginning. We were sure that we wanted to have the possibility to swipe (left and right) to discover new tips, but we also thought of having the option to change the view if the user wanted to access more quickly to a chosen tip. In the end we decided to base our layout on concept b), that we modified a little bit. However, we thought that it would be interesting to present here all the concepts we were thinking about.

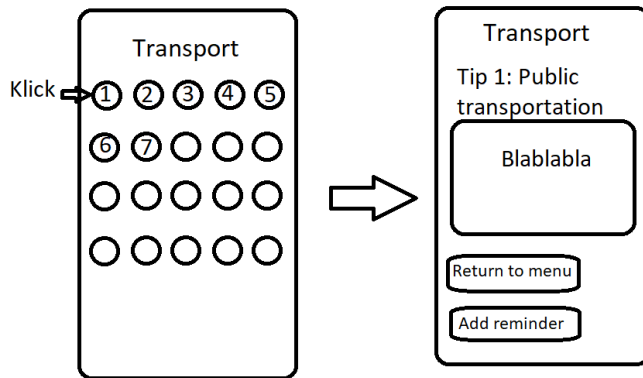

a)

This was our first concept with having a first topic page with a vertical scroll layout of topic cards from which we could access (by swiping right) the tips in the chosen small subcategory (topic). We could then discover the tips in the chosen topic by going to the next page (without the swipe system).

b)

In this layout the first page contains a vertical scroll layout (like in a)) of the tips headers. The user can choose the header that draws his attention by clicking the header card(button) and accesses the corresponding tip card (with its content) in our slide system. When implementing this solution, we added the possibility to switch views from the tip header page directly to the slide-card system, where the user can discover tips just by sliding left and right.

c)

This was the last concept that came to our minds to have two different view or possibilities to access the tips. We thought of starting from the tips slide-card system as the standard layout and having the possibility to change view to the one on the left, where the user choosing the number of the tip can access it quickly without having to swipe to it. In the end we rejected this solution as we found it less interesting and intuitive (the user should know which tip had which number).
